Final

March 28, 2020

For this homework, make sure that you format your notbook nicely and cite all sources in the appropriate sections. Programmatically generate or embed any figures or graphs that you need.

Names: Calvin Zikakis, Sarah Schwallier

0.1 Section 1: Word2Vec paper questions

`1) Describe how a CBOW word embedding is generated.`

CBOW word embeddings are generated by using an unsupervised deep learning algorithm. This architecture creates an input using the context of each word and then the model tries to predict the word that corresponds to the context.

`2) What is a CBOW word embedding and how is it different than a skip-gram word embedding?`

CBOW uses inputs to predict outputs by using a set number of words before and or after the word it is trying to predict. This method of prediction relys on the context of the word. Skip-grams use a given target input to predict the context word. CBOWs and Skip-grams models are reflections of each other in the sense that CBOW is predicting a word from a context while a skip-gram is predicting a context from a word.

`3) What is the task that the authors use to evaluate the generated word embeddings?`

Authors want to make sure that their generated word embeddings are as accurate as possible using semantic questions. Where the ideal model has a high complexity and is able to predict against an independent data set with high accuracy.

`4) What are PCA and t-SNE? Why are these important to the task of training and interpreting wo`

T-SNE are multi-dimensional word embeddings consisting of word test set sentences that are based upon probability. PCA on the other hand is computed by using matrices and is based on more mathematical approaches. Both of these models are trying to reduce the dimensionality of matrices and vertices to compute a graph. These are important for training and interpreting word embeddings because they both visualize the data that was computed in a way such that the people interpreting the results can analyze the data easily.

0.3 Section 2: Training your own word embeddings

The spooky authors dataset consists of excerpts from authors of horror novels including Edgar Allan Poe, Mary Shelley, and HP Lovecraft. These excerpts each have a unique ID as well as a three letter tag describing which author wrote the excerpt. The data is split into a training set and a test set. The test set is lacking the three letter code which labels the author.

We are using the The Blog Authorship Corpus for our secondary dataset. We decided on this dataset as it is comprised of 681,288 posts from 19,320 bloggers. We scanned through this database and pulled a small chunk of the total amount of posts. This was to reduce the overall size of the dataset to help with performance in training word embedding. This dataset will provide a data that is written with a style simular to normal human conversation simularly to the spooky authors dataset. This should help insure our generated sentences have a natural sound to them.

The analysis below is using the following images and information:

From the charts and diagrams above one can see that both datasets produced similar looking results that contain different data and meaning. The results above were computed by having a random index that corresponds with a word. The word selected for the primary data set was ‘coat’ and for the secondary was ‘rocks’, both words are bolded in the 2D graphs above. If the word in the primary dataset was in the secondary dataset then it moved onto the next step which was finding the closest 10 words that a word2vec embedding matched with the randomly selected word. For the secondary it did the same thing but instead it checked if the selected word was in the primary dataset. From there each list of similar words was then evalulated against their own list to find the word that did not match the other words in the list. For the primary dataset we found out that the word ‘stooped’ (in red) did not match the other ten and for the secondary dataset it was the word ‘puzzle’ (in purple). Then a 3D and 2D graph was made to reflect the results. The primary was graphed in teal and the secondary was graphed in coral.

In comparing the primary dataset which is composed of the supplied assignment horror corpus against our blog corpus which was smaller. It is evident in the spread of the PCAs that the dataset has more vertices for the ‘cloud’ in the graphs is more dense and full. While the secondary dataset has a smaller density area with more outliers. We see these differences between the two datasets because of the size of each corpus and the variety of words within the corpi. The primary dataset was larger which led to the results being more accurate.

An Introduction to Natural Language Processing, Computational Linguistics, and Speech Recognition by Daniel Jurafsky and James H. Martin

1 Quality Evaluation

1) the organs of lectures forbearance decayed admission shrank denied cried judge polished

2) there was a now immortal advancing response protested considered adversity than sunlight Joey -

Sentence 2 is more grammatical

Both sentences are equally sensical (or nonsensical)

Ford -

Both sentences are equally grammatical (or ungrammatical)

Sentence 2 makes more sense

1) by one of form this differed omen yellowish knxw demurely inextricable wine

2) here let us britain suggestion tyrants sensibility gibbering manifest window despair shook Joey -

Sentence 1 is more grammatical

Both sentences are equally sensical (or nonsensical)

Ford -

Both sentences are equally grammatical (or ungrammatical)

Sentence 1 makes more sense

1) you say that relates excessive carousals dubious others glimpses disgraced godlike demons

2) when first i iron crew process clerical dungeon fragrance return ring by Joey -

Both sentences are equally grammatical (or ungrammatical)

Both sentences are equally sensical (or nonsensical)

Ford -

Sentence 2 is more grammatical

Sentence 2 makes more sense

Sentence 1 was always the FFNN while sentence 2 was the RNN. The RNN seems to make better sentences but neither of the networks produced great results.
